LAYER 01 / 60-MINUTE AUDIT

What NIAT really sells

Public evidence checked 15 October 2026 • observed channels distinguished from challenge-brief channels

What NIAT actually is / 78 words

NIAT is NxtWave's four-year industry-skilling layer for students enrolled at collaborating colleges. The university handles the degree and its academic credits; NIAT provides separate, non-credit, project-heavy training in software, AI and related fields. NIAT is not itself a university and does not award a B.Tech degree. This means the decision is really about a specific university-campus offering plus NIAT training, not one identical "NIAT college" everywhere. Admissions, campus amenities, pricing and degree particulars need institution-specific verification. [1, 2]

Acquisition + conversion avenues already in motion

Apply / NAT funnel	Official site → brochure, application portal and NxtWave Assessment Test → qualification / counsellor conversation. [1, 3]
AI bootcamps	Free weekend build sessions for Class 12 completers create engagement and registrant intent. [4]
Masterclasses	Expert sessions let prospective learners sample the promised teaching experience. [1]
Parent proof	Parent testimonials, student achievements and recruiter stories reduce perceived risk. [1, 5]
WhatsApp + counsellor	Website links to WhatsApp and human counselling for questions and admissions guidance. [1]
Organic social + video	Official LinkedIn storytelling and linked YouTube clips distribute curriculum and outcome narratives. [1, 6]
Schools + campus activations	School/inter-college events and campus touchpoints create face-to-face leads (stated in assignment brief). [7]
Influencers + paid media	Influencers, counsellor networks and performance ads broaden reach (stated in assignment brief; spend unverified). [7]

The two most relevant rivals — where each is ahead

Scaler School of Technology. Its admissions page publicly itemises tuition, hostel and parallel-degree fees in far more detail; that makes initial cost comparison easier than NIAT's campus-dependent, counsellor-led disclosure. [8, 3]

Newton School of Technology. It places a dedicated internship report and student internship share prominently on its undergraduate page — a sharper cohort-specific proof presentation than NIAT's cross-program outcome headlines. Figures are school-reported, not independently audited here. [9, 5]

The detail that changes the strategy

Buried under NIAT's attractive outcome numbers is a scope disclaimer: some results include other NxtWave programs, including online cohorts. Meanwhile NIAT says it neither awards the degree nor guarantees a job. The parent's fear is not simply "will my child learn AI?" — it is "which promises apply to this campus, this degree, this batch?" That is a conversion bottleneck a generic follow-up sequence cannot solve. [1, 5]

LAYER 02 / TRACK B • LEAD → SALE

The two-seat Decision Lab

One new conversion mechanism, not a chatbot, landing page, or WhatsApp drip

The new avenue

Invite an already-interested household into a two-seat decision room. The student independently explains what excites or worries them; the parent records what proof they need. A local NLP model labels the two issues, finds where they diverge, generates only source-linked evidence cards, and opens specific proof-request tickets for a human counsellor. The parent can see what is known, what is not, and the next document to request. The resulting handoff is a structured question — not another “Are you interested?” call.

Why this is new — and distinctly NIAT

Public NIAT touchpoints already include counsellors, FAQs, testimonials, NAT, WhatsApp and bootcamps; I did not find a public, asynchronous two-person concern-comparison workflow with verified, campus-specific evidence requests. Internal tools cannot be ruled out. NIAT’s multi-institution model makes a single sales script risky: degree issuer, fees, campus, conditions and relevant outcomes need a joint, written decision trail. This turns the exact uncertainty in the audit into the conversion lever.

The falsifiable bet ● best-guess assumptions, not facts

Take 400 existing warm, consented households with a student + parent decision-maker. Randomly assign 200 to current counselling (control) and 200 to a Decision Lab invitation plus usual service. Assume ~50% of treatment households complete both seats (~100 pairs). Hypothesise a 7-day verified next-step rate of 18% (36/200) in treatment versus 10% (20/200) in control: +8 percentage points, not a forecast. At this sample size the result is a directional pilot, not guaranteed statistical proof.

The ONE experiment: 7-day matched-service randomised pilot

Day 0: randomise qualified leads at household level; exclude duplicates and cases without an appropriate consenting decision-maker. Both arms retain the same counsellor availability. Treatment receives a private two-seat link; evidence tickets enter a staff queue. Counsellor closes tickets only after providing written primary evidence. Day 7: analyst, blinded to assignment where practicable, validates completed NAT booking / campus-specific evidence appointment or another agreed admissions next step in CRM. No automated outreach to minors; no payment or enrolment claims from the model.

Win condition + guardrails

Primary KPI = verified next-step households ÷ all randomised households (intent-to-treat). Scale only if treatment beats control by ≥6 absolute percentage points, ≥40% of invited treatment households complete both seats, and zero substantiated misleading degree/fee/placement claims occur. Secondary: time-to-evidence-answer, ticket resolution, no-show, parent/student completion and incremental staff minutes. If promising, rerun a larger powered trial measuring enrolments and cost per enrolled student.

Already built, connected and tested

Working FastAPI intake → real scikit-learn concern classifier → official source-card retrieval → SQLite event log & action tickets → protected counsellor queue / CSV → live local dashboard. Optional server-side OpenAI synthesis is disabled without a valid API key. Six synthetic demo cases are visibly separated from real prototype events. Public hosting and Loom publishing remain deployment steps; they are not represented as complete.

Research: niatindia.com • niatindia.com/campus • niatindia.com/placements • niatindia.com/ai-bootcamp • NIAT application portal (checked 15 Oct 2026). The 400-household design assumes access and consent from NIAT; none has been provided.

LAYER 04 / REFLECTION

Build quickly. Verify slowly.

Both responses below are under 100 words; based on the work completed for this prototype.

01 / What did I learn about myself?

I learned that my first instinct is to add automation before asking whether the premise is true. Reading NIAT's fine print changed the direction of the build: the university awards the degree, NIAT provides a separate skilling layer, and some headline outcomes span more than NIAT alone. Those distinctions suggested a better growth tool than more reminders. I also learned to separate "it runs locally" from "it is ready for families." A working flow is only the start; permissions, evidence quality and a responsible human handoff are part of the product.

02 / My score out of 10 — and why

I would give this submission 6/10 in its current state. The research led to a differentiated hypothesis, and I built and tested a multi-component system with real ML classification, an evidence library, a persistent action queue and a dashboard. I did not prove conversion uplift, get NIAT counsellors to validate campus-level answers, or publish a live public app and Loom recording. The sample cases are synthetic, not customer results. I would raise the score only after deploying it, demonstrating the actual hosted user flow, and collecting credible experiment outcomes.

Build receipt / what an evaluator can verify

Inputs	Separate student and parent forms; private invitation code; explicit consent.
Model	Trained TF-IDF + logistic-regression NLP; real predict_proba inference.
Grounding	Official NIAT sources + caveat for every evidence statement.
Workflow	Follow-up tickets, protected staff queue, CSV export, event data.
Measurement	Dashboard segregates synthetic records; no fake conversion figures.
Verification	Automated unit/end-to-end tests; start/deploy instructions included.

Submission links / to be completed after publishing

Public demo: [not yet hosted; deployment required]

Short Loom: [not yet published; walkthrough video included in package]

These are honest placeholders, not fake links. The supplied challenge requires both public URLs. All outputs are clearly labelled as independent prototypes rather than official NIAT services.
